

Energy Efficiency Case Study

Our products solve an array of challenges related to the collection, management, analytic, and reporting of energy-related information. Our products are used by leading Utilities to manage large scale energy efficiency programs. CTS Managed Mobility Services keep us up and running and leave us to our expertise.

The largest electric utility in the country wanted to make energy audits available to their millions of customers across nine states. This required providing their EE auditors with the tools to make them mobile in-field, able to run the results in real-time, and act as a consultant to their clients as they recommend energy-saving opportunities on the spot no matter where they are in the region.

CTS enables their Award Winning end-to-end EE Program with a turnkey technology platform powered by Verizon data plans. CTS provides mobile devices, deployment and supervision via CTS Managed MDM and full warranty/uptime services. The client entrusts CTS to meet the SLA-driven 99%+ uptime to ensure they can run best practices to drive energy savings, reduce operational costs and improve customer satisfaction across millions of clients. All aspects of the Technology Platform are supported by CTS, one call for any issue, all costs accounted for in comprehensive TCO approach with zero out-of-pocket to client.

Savings of nearly 37 gigawatt-hours of electricity translating to millions of dollars in reduced electricity generation and system costs for customers. These results have been achieved on budget, on time, with zero unplanned costs. The results have exceeded expectations on program performance in all metrics.
